

"Wireless" Traffic Control Solutions

APPLICATION: *TraffiCalm Signs to Navajo Community*

LOCATION: Navajo Community, Kayenta, AZ, U.S.A.

Description

Solar Traffic Controls has furnished three TraffiCalm Driver Feedback Urban signs for the Navajo Community of Kayenta, AZ. The township serves as the jumping off point for visitors to Monument Valley at the Arizona/Utah border.

To raise awareness and provide traffic calming for visitors unfamiliar with the speed limits, the township opted to install a radar speed sign at each approach into town.

The TraffiCalm DFBU was selected since it has the dual-color display, amber for normal and warning levels of speed and red flashing numerals for over speed conditions.

All signs were configured for solar-powered operation as solar is an abundant free resource in the Four Corners area. STC worked with AJP Electric of Phoenix to install the project on site.

Take these steps to insure the success of your solar-powered project:

1. Location - identify the site of the application; for example, the nearest town, village or city and state.
2. Load - specify the number and size of lamps, timers or other controls (anything which draws power).
3. Duty Cycle - determine how many hours per day and which days per week the load will be drawing power.

Solar Power: a free source of energy

STC's solar-powered systems are designed for quick and easy installation in the field. Our careful front-end engineering minimizes your installation costs and provides years of trouble-free operation. The standard solar power system includes the solar array, system enclosure with all the necessary electronics, color-coded wiring harnesses, sealed batteries and full documentation. DC LED lamp kits can also be purchased. These include the LED beacon, lamp housing and mounting hardware.

STC Systems are Cost Effective

Our solar flasher systems allow you to stretch your budget to obtain the traffic safety devices you need at affordable prices. Most systems are equivalent to the cost of obtaining an AC power drop. Battery life is typically three to six years; less expensive than grid electricity for the same period of time.

Solar Traffic Controls (STC) provides solar-powered traffic control systems for city, state and federal DOTs; police, firefighting and public works departments; facility maintenance and plant safety industries. Our primary products are solar-powered flashing beacon systems used for school zones and 24-hour applications. We also supply specialized flasher systems using environmental sensors and custom communications packages to control the flashing beacon systems. Our product spectrum also includes wireless power systems for ITS, EMS and HAR. STC's products and services are sold through a network of regional distributors who offer technical support for your project.
